

CASE STUDY

Stanton & Company sees every client's KPI pace *each Monday*

A weekly digest whose numbers come from code, not AI, built in Stanton's own Google accounts and run by their team.

"Before the digest we weren't tracking KPIs consistently. Someone would sit down every so often and spend an hour piecing together where each account stood. Now it's clear right away how we're tracking against our targets."

Emily Michels, Director of Operations, Stanton & Company

S&Co.

Snapshot

CLIENT

Stanton & Company, a health and wellness PR and marketing agency in Venice, CA, about 25 people

BUILT

A weekly KPI digest that reads every client tracker and emails leadership Monday and Tuesday mornings

RESULT

Leadership sees where every account stands on Monday morning, and Stanton's own team rolled out the full client roster and runs it

TIMELINE

Started June 2026, first digest late July, run by Stanton's team since August

RUNS IN

Stanton's Google Workspace and Google Cloud accounts, set up and administered by their IT partner

MY ROLE

Design, build, hand off

THE PROBLEM

Good records, no weekly answer

Stanton's account teams already kept good records. Every client had a tracker in Google Sheets, KPI targets set at the start of the engagement, and a priorities email that each account manager sent on Monday morning.

Each tracker answered for its own account. What leadership did not have was one weekly answer to the question that matters most in retained PR: are we on pace against what we promised each client? Seeing every account side by side meant opening each tracker and doing the math by hand, which could take hours.

Amy Stanton wanted that picture every Monday, built so her team kept working the way they already did and owned the result.

THE BUILD

What I built

A weekly digest the team named KPI Bob. It reads each client's tracker and the master KPI sheet. It works out where every account stands against its goals for its own goal period. It sorts accounts into On track, Watch or Needs attention (early-stage accounts show as Building), each with a one-line reason, and it checks whether the week's priorities are aimed at the KPIs that need the most help.

It sends Monday and Tuesday at 9:30 Pacific. Monday is the read. Tuesday picks up late inputs and holidays and shows what moved since the day before. Two formats: a short email listing only the accounts that need a look, and a full browser view with every account and every KPI.

Weekly KPI Digest | Monday

3 accounts shown. Sample week.

ILLUSTRATIVE, SAMPLE DATA

Account	Band	Read
Harborline Naturals	On track	Month 4 of 12. 5 of 6 KPIs at or ahead of pace.
Larkfield Paper Goods	Watch	Month 7 of 12. 3 of 5 KPIs on pace. Feature placements at 78% of pace.
Meadowfield Kitchen	Needs attention	Month 2 of 6. 2 of 4 KPIs on pace. This week's priorities skip both lagging KPIs.

THE OUTCOME

What changed

Leadership sees where every account stands on Monday morning, in one place, before the week starts.

A team member who volunteered to own the system rolled the full client roster onto the digest through August. She now adds clients, adjusts targets and edits the recipient list herself. When Emily joined as Director of Operations in September, I walked her through how one tracker becomes one digest row.

UNDER THE HOOD

How it works

The data path. The only new habit is one CC on an email the team already sends. Account managers keep updating their trackers the way they always did and copy the digest's mailbox on their Monday priorities email. A sheet lists every account, its tracker, its status (active, onboarding, paused) and its targets. The digest reads live from those files on every run, so fixing the sheet fixes the next digest.

The numbers check. Every figure, band and flag is calculated by ordinary code, not by the AI. AI handles language only: reading the week's priorities and writing the bottom-line summary. Every number in AI-written text is checked against the computed values before it can go out. If the AI is unavailable, a plainer template ships instead. Monday does not depend on an AI service being up.

The ownership model. Everything runs inside Stanton's Google Workspace account and Google Cloud project, billed to Stanton and administered by their IT partner from day one. The AI runs on Stanton's own account, where prompts are not used to train Google's models. Nothing runs on my keys or my servers. Stanton received a full copy of the code, an operations guide for the internal owner, an infrastructure guide for IT, a failure playbook and a one-button rerun. Run cost is a single Workspace seat plus metered AI usage. The digest does not depend on me to arrive on Monday.

LESSON LEARNED

One thing I got wrong at first

My first design read only each tracker's current tab, which would have lost the cumulative picture as the months rolled over. I rebuilt it to read the whole workbook, and that is how it runs today.

NEXT STEP

If this sounds like your team

If your numbers live in spreadsheets and your weekly view lives in someone's head, email me at jon@freshcoast.ai with how you track client goals today and I'll tell you whether this pattern would fit.
